

CyberPatrol Online Protection PRO

PROACTIVE SECURITY

Malware is on the rise and can put companies at serious risk. It can happen through innocent browsing. The simple act of clicking on a link can load up a computer with devastating malicious code.

Taking a proactive approach and stopping attacks before they happen is increasingly becoming a requirement in a company's security strategy. With CyberPatrol Online Protection Pro it's easy to block the most notorious offenders of malware such as porn and hacking sites.

What is Online Protection PRO?

CyberPatrol Online Protection Pro is designed for use in a business or educational environment to monitor and filter internet activity and online chat. You can easily customize filtering capabilities by selecting from 44 categories or by creating your own block and allow list of websites. Administrators receive email activity reports that can monitor for sexual content and harassment. Custom settings can be enforced by user or PC. Administrators can easily manage filtering requirements through one interface that can be monitored remotely from any PC that is connected to the Internet.

How Online Protection Pro Works

CyberPatrol Online Protection Pro guards against today's most common online threats. It is a service that uses a web site, the Safety Center, and a small software program, the Scanner, on any Windows PC with users you want to safeguard.

The Safety Center is used to manage computers, users, and protection levels for each computer and user. Once you have activated the Safety Center, you can manage any computer that has the Scanner installed. The number of computers is determined by the license(s) purchased. There is no limit to the number of individual users that can be protected on each PC.

With Online Protection Pro, you can:

- Protect multiple computers and users from a single online location, the Safety Center
- Access the Safety Center from any computer with an Internet connection
- Create separate protection levels for each user
- Receive threat alerts and reports sent directly to your e-mail
